

GROUND REFERENCED PIXEL RESET

By Matthew M. Borg

Abstract

A ground referenced pixel reset circuit is disclosed.

- 5 The ground referenced pixel reset circuit supplies a pixel with a reset signal such that when the reset signal is asserted high, the reset signal is at a ground referenced reset voltage independent from a supply voltage. The pixel includes a photosensor, such as a photodiode, that is
- 10 coupled to a ground having a same potential as the ground of the reference voltage supply. In this manner, noise caused by fluctuations in the supply voltage is reduced.
